

About NexLP

Our Ai software of choice features the industry's most advanced tools for finding evidence.

In Concert with Relativity

NexLP doesn't replace Relativity, or any other SQL based discovery platform, it enhances them. As a big picture case-management platform, Relativity is unmatched. For laser focused evidence finding, NexLP is the best available tool.

Predictive Modeling x3

When creating a predictive model to identify the important documents in your case - NexLP actually runs 3 separate predictive algorithms using three different Ai methodologies. It then automatically chooses the model that produced the best results. This allows us to find more evidence in less time.

Saved Models Save Time

Once we've created a model, it can be re-used. For example, once we've created a search model for "sexual harassment" or any legal concept, we can apply that same model to any other data set. Meaning next time we have to deal with a similar case, we're already way ahead of the curve.

Pre-built Models

For many common legal issues, we can save time by beginning our work with an out-of-the-box model provided by NexLP.

Emotional Ai

Happy, sad, defensive, or under pressure. NexLP can use emotional state to help identify content.

Pattern Recognition

Incidents of interest tend to break typical patterns (Increased email volume, etc.)

Adjustable

The parameters of NexLP are fully adjustable, which allows us to fine tune our models.

Classifiers

More classifiers means a more accurate, nuanced model. NexLP has over 50.

Introducing BERT

Harness the power of language not words. NexLP is the first legal software to integrate Google BERT.
